Alana Edwards

Associate GTM Engineer

October 17, 2026

Dan Blinick
Director of Revenue Operations
LeanTaaS

Dear LeanTaaS Revenue Engineering Team,

I applied for the Associate GTM Engineer role because it sits at the intersection of three things I'm passionate about: work that helps people, understanding how a business runs, and building software that solves real problems.

What first drew me to LeanTaaS was the impact of your software. I want my engineering to contribute to outcomes patients can feel, like shorter wait times and better access to care.

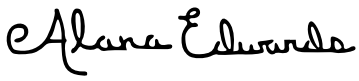
I've always had an interest in the business side of technology. I was in a business program where I explored deep tech commercialization, which sparked my interest in roles that connect technical work to business outcomes. The Associate GTM Engineer role is an opportunity to contribute code while learning how revenue and operations work.

My experience has prepared me to contribute to the Revenue Engineering team. At Allegion, I replaced a manual CSV upload with a direct database load and cut the underlying query from about five minutes to just over one. I also updated data sources, credentials, and queries across more than 200 reports and Excel files during a server migration. In the Meta x MLH Fellowship, I deployed a containerized app with Docker and Nginx, built a GitHub Actions pipeline where deploys only run after tests pass, and set up Slack alerts for failed builds along with a Prometheus and Grafana dashboard that alerts on CPU spikes. My recent project, History or Mystery?, a real-time two-player trivia game built with Rails and PostgreSQL, follows the same habits: automated security and style checks gate every deploy.

Beyond engineering, I've taught adult learners as an instructor and supported students as a bootcamp teaching assistant. Those experiences strengthened my ability to explain technical concepts to people with different levels of technical knowledge, which is a skill I'd bring to collaborating with Sales, Finance, and Legal.

I regularly use AI tools as a pair programmer to debug problems, compare approaches, and understand unfamiliar codebases quickly. I design and write solutions myself, and I treat AI output as a starting point to evaluate and verify.

I'd love to bring my experience building reliable, well-documented systems with automation, testing, and monitoring to the Revenue Engineering team, and to contribute to a company that improves patient access, shortens wait times, and lowers the cost of care.

Thank you.


Sincerely,
Alana Edwards
